Wart Therapy Instructions
Use of Triple Acid Therapy

This triple acid formula is composed of three acids (lactic, salicylic and trichloroacetic). This is a strong formula meant to remove the skin cells penetrated by the wart virus, the human papilloma virus. Please understand that treating warts can be a slow process and many sometimes take weeks of therapy.

If your warts have been treated in the office, do not begin using the formula until the crust, which formed over the lesions, falls off. Then, nightly, paint all your warts with a thin coat of the solution and cover the area with plastic tape. This will allow for better penetration of the solution into the skin. In the morning, you may gently remove the dead skin with a pumice stone. This will allow for better penetration of the wart medicine on the following night.

If you experience any discomfort, use the formula less frequently. You must establish your own routine that is comfortable for you. If you have not been treated in the office, then you may begin using the formula anytime. Do not hesitate to call if you have problems.
